

Name: \_\_\_\_\_

Block: \_\_\_\_\_

IV. Acids & Bases (part 1)IV.1 Arrhenius Acids & Bases

You will be able to:

- Define Arrhenius acids and bases
- Write balanced equations representing the neutralization of acids by bases in solution
- List general properties of acids and bases

<b>Arrhenius definitions:</b>	<b>ACID</b> _____
	<b>BASE</b> _____
	<b>SALT</b> _____

All neutralization reactions are based on the fact that acids produce \_\_\_\_\_ and bases produce \_\_\_\_\_.

*Net ionic equation:* \_\_\_\_\_

**Balancing A+B equations:**

**Example 1: Balance the neutralization equation of HCl and Sn(OH)<sub>4</sub>**

Step 1: Count the number of H's and OH's in the acid + base formula	
Step 2: Balance H's and OH's using coefficients	
Step 3: Write products as the number of H <sub>2</sub> O molecules and formation of salt	

**PROPERTIES**

<b>Acids (H<sup>+</sup>)</b>	<b>Bases (OH<sup>-</sup>)</b>
a)	a)
b)	b)
c)	c)
d)	d)
e)	e)

## IV.2 Common Acids & Bases

You will be able to:

- Write names and formulae of some common household acids and bases
  - Outline some of the uses and commercial names of common household acids and bases
- .....

### **ACIDS**

Name	Formula	Properties	Uses
Sulphuric acid			
Hydrochloric acid			
Nitric acid			
Acetic acid			

### **BASES**

Name	Formula	Properties	Uses
Sodium hydroxide			
Potassium hydroxide			
Ammonia			

**Do WS 4-1: Common Acids & Bases; Hebden set 21 p. 110 #2abef, 3, 4, 7, 9**

## IV.3 – IV.4 H<sup>+</sup> and Brønsted-Lowry Acids & Bases

You will be able to:

- Identify an H<sub>3</sub>O<sup>+</sup> ion as a protonated H<sub>2</sub>O molecule that can be represented in shortened form as H<sup>+</sup>
  - Define Brønsted-Lowry acids and bases and identify Brønsted-Lowry acids and bases in an equation
  - Define amphiprotic
  - Describe situations in which H<sub>2</sub>O would act as an acid or base
- .....

$H^+$  is very reactive: highly concentrated positive charge that is very attracted to any negative charge.

$H^+$	$H_2O$	$H^+ + H_2O \rightarrow H_3O^+$	
$H^+ =$ _____		$H_3O^+ =$ _____ or _____	Therefore, $H^+ (aq)$ is actually $H_3O^+ (aq)$ when you write the IONIZATION of an acid.

All acid solutions contain hydronium ( $H_3O^+$ ) ions. It is the hydronium ion which gives all acids their properties (like sour taste, indicator colours, reactivity with metals etc.)

### Writing the dissociation of acids in water:

**Example 2: Write the ionization equation when  $HCl_{(g)}$  is added to water to produce  $HCl_{(aq)}$ .**

Previous way: \_\_\_\_\_

Ionization equation: \_\_\_\_\_

Brønsted-Lowry theory of acids and bases allows for \_\_\_\_\_.

**Brønsted-Lowry definitions:** **ACID** \_\_\_\_\_

**BASE** \_\_\_\_\_

- When a substance **loses a proton** ( \_\_\_\_\_ ), it turns into something with \_\_\_\_\_ and \_\_\_\_\_ (which means the same as one more (-) charge.)
- When a substance **gains a proton** ( \_\_\_\_\_ ), it turns into something with \_\_\_\_\_ and \_\_\_\_\_ (which means the same as one less (-) charge.)

\*According to Brønsted-Lowry definitions,  $\text{H}_2\text{O}$  can act \_\_\_\_\_.

**AMPHIPROTIC** = \_\_\_\_\_

Examples:  $\text{H}_2\text{O}$ ,  $\text{H}_2\text{PO}_4^-$ ,  $\text{HS}^-$ ,  $\text{HCO}_3^-$

*\*In every Brønsted-Lowry reaction, there is an acid and a base on BOTH sides of the equation.\**

**Example 3ab: Determine which substances are acids and bases in the following B-L equations:**

Step 1: Determine which reactant gains or loses a proton	<u>Ex. A</u> $\text{CH}_3\text{COOH} + \text{H}_2\text{O} \rightleftharpoons \text{CH}_3\text{COO}^- + \text{H}_3\text{O}^+$	<u>Ex. B</u> $\text{NH}_3 + \text{H}_2\text{O} \rightleftharpoons \text{NH}_4^+ + \text{OH}^-$
Step 2: Determine the opposite substance on the products side (conjugate pair)		
Step 3: Each side must have BOTH an acid and a base		

**Do Hebden set 22: p. 115-119 #10, 11, 13, 14**

### IV.5 Conjugate Acids & Bases

You will be able to:

- Define conjugate acid-base pair
- Identify the conjugate of a given acid or base
- Show that in any Brønsted-Lowry acid-base equation there are two conjugate pairs present

- A Brønsted-Lowry acid-base reaction just involves an equilibrium proton transfer.
- If a proton is transferred during the *forward* reaction, we can also assume there will be a proton transfer in the *reverse* reaction.

**CONJUGATE ACID-BASE PAIR (or CONJUGATE PAIR) =** \_\_\_\_\_

**CONJUGATE ACID** is \_\_\_\_\_

**CONJUGATE BASE** is \_\_\_\_\_

**In the equilibrium reaction,  $\text{NH}_4^+ + \text{H}_2\text{O} \rightleftharpoons \text{NH}_3 + \text{H}_3\text{O}^+$ , there are two conjugate pairs.**

Conjugate pair	Conjugate acid	Conjugate base

**Example 4: Identify the conjugate acid-base pairs in each of the following reactions:**

Pair 1: (acid) \_\_\_\_\_ (base)

Pair 2: (acid) \_\_\_\_\_ (base)

Pair 1: (acid) \_\_\_\_\_ (base)

Pair 2: (acid) \_\_\_\_\_ (base)

**Example 5: To determine the conjugate base or conjugate acid of a given substance,**

Example: Give the conjugate base of  $\text{H}_2\text{PO}_4^-$  \_\_\_\_\_

Example: Give the conjugate acid of  $\text{HSO}_4^-$  \_\_\_\_\_

**Do Hebden set 23: p. 121 #16-19**

**IV.6 “Strong and Weak” Acids & Bases**

You will be able to:

- Relate electrical conductivity in a solution to the total concentration of ions in a solution
- Define and give several examples for the following terms: strong acid, strong base, weak acid, weak base
- Write equations to show what happens when strong and weak acids and bases are dissolved in water
- Compare the relative strengths of acids or bases by using a table of relative acid strengths
- Predict whether products or reactants are favoured in an acid-base equilibrium by comparing the strength of the two acids (or two bases)
- Compare the relative concentrations of  $\text{H}_3\text{O}^+$  (or  $\text{OH}^-$ ) between two acids (or between two bases) using their relative positions on an acid strength table

- WEAK and STRONG refer to \_\_\_\_\_.
- DILUTE and CONCENTRATED refer to \_\_\_\_\_.

A **STRONG ACID** or **BASE** is \_\_\_\_\_

A **WEAK ACID** or **BASE** is \_\_\_\_\_

See Data table, “Relative Strengths of Bronsted-Lowry Acids and Bases” (p. 334 Hebden)

- Equilibrium (double arrow) reactions involve *weak* acids and bases, NOT *strong* acids and bases.

Strong acids	Weak acids (left)	Weak bases (right)	Strong bases
100% ionization one-way arrows high $K_a$ <u>Examples:</u> $\text{HClO}_4, \text{HI}, \text{HBr}, \text{HCl},$ $\text{HNO}_3, \text{H}_2\text{SO}_4$  In a <b>Strong Acid</b> , $[\text{H}_3\text{O}^+] = [\text{Acid}]$	Less than 100% ionization (usually < 5% ionized) double arrows (equilibrium) $K_a = 1.0 \text{ to } 1.0 \times 10^{-14}$  <i>Amphiprotic</i> compounds can be on <i>both sides</i> (left acting as an acid, on the right acting as a base.)  Ex.) $\text{H}_2\text{PO}_4^- \rightleftharpoons \text{H}^+ + \text{HPO}_4^{2-}$ Ex.) $\text{H}_3\text{PO}_4 \rightleftharpoons \text{H}^+ + \text{H}_2\text{PO}_4^-$	100% ionization one-way arrows low $K_a$ <u>Examples:</u> $\text{O}^{2-}$ and $\text{NH}_2^-$ metal hydroxides: $\text{NaOH},$ $\text{KOH}, \text{Mg}(\text{OH})_2, \text{Ca}(\text{OH})_2,$ $\text{Fe}(\text{OH})_3, \text{Zn}(\text{OH})_2$  In a <b>Strong Base</b> , $[\text{OH}^-] = [\text{Base}] \times \# \text{ of}$ $\text{OH}'\text{s in formula}$	

The stronger the **ACID**, the a) \_\_\_\_\_,

b) \_\_\_\_\_,

c) \_\_\_\_\_.

The stronger the **BASE**, the a) \_\_\_\_\_,

b) \_\_\_\_\_,

c) \_\_\_\_\_.

**Example 6: What is  $[\text{H}_3\text{O}^+]$  in 0.20 M HCl?**

Step 1: Write out ionization of HCl in $\text{H}_2\text{O}$	
Step 2: Use molar ratio to determine [ ]	

**Example 7: What is the  $[\text{H}_3\text{O}^+]$  in 0.40 M sulphuric acid?**

Step 1: Write out ionization of acid in $\text{H}_2\text{O}$	
Step 2: Use molar ratio to determine [ ]	
<i>Note: The STRONG acids all have the same strengths in aqueous solutions. <math>[\text{H}_3\text{O}^+] = [\text{acid}]</math></i>	

**Example 8: What is the  $[\text{OH}^-]$  in 0.10 M  $\text{Ba}(\text{OH})_2$  ?**

Step 1: Write out ionization of $\text{Ba}(\text{OH})_2$ in $\text{H}_2\text{O}$	
Step 2: Use molar ratio to determine [ ]	

*The **strongest base** which can exist in high concentrations in water solution is  $\text{OH}^-$ .  $\text{H}_3\text{O}^+$  is the **strongest acid** that can exist in an undissociated form in water solution.*

*\*Concentration of ions determines its electrical conductivity.\**

### Acid-Base Equilibria & Relative Strengths of Acids & Bases

- *Equilibrium favors the side with the weaker conjugate acid and the weaker conjugate base.  
“only as strong as weakest link” or “strong push the weak”*

**Example 9: Consider the mixing of  $\text{H}_2\text{PO}_4^-$  and some  $\text{CO}_3^{2-}$ . At equilibrium, which will be favoured, reactants or products?**

Step 1: Determine which reactant acts as the acid and base	
Step 2: Write out ionization equation	
Step 3: Determine which is the stronger of the 2 acids	
Step 4: Equilibrium favours the side of the weaker acid	

**Example 10: Complete the reaction of  $\text{HSO}_4^- + \text{H}_2\text{PO}_4^-$ . At equilibrium, which will be favoured, reactants or products?**

Step 1: Determine which reactant acts as the acid and base (both are amphiprotic)	
Step 2: Write out ionization equation	
Step 3: Compare the two conjugate acids	
Step 4: Equilibrium favours the side of the weaker acid	

**Example 11: Complete the net ionic reaction between two salts,  $\text{NaHSO}_3$  and  $\text{K}_2\text{HPO}_4$ , and state whether equilibrium favors reactants or products.**

Step 1: Write the dissociation equation for each reactant. Discard spectators of A-B reactions*	
Step 2: Determine which reactant acts as the acid and base	
Step 3: Write out ionization equation	
Step 4: Compare the two conjugate acids	
Step 5: Equilibrium favours the side of the weaker acid	

\*NOTE: All alkali ions  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Li}^+$  ...etc..... are *spectators* in Acid-Base reactions. Also top five ions right side of acid chart ( $\text{ClO}_4^-$ ,  $\text{I}^-$ ,  $\text{Br}^-$ ,  $\text{Cl}^-$ ,  $\text{NO}_3^-$ ) are *spectators* in Acid-Base reactions.

#### **Relating $K_{\text{eq}}$ to acid-base equilibrium**

If products are favored  $K_{\text{eq}}$  is large ( $>1$ )

If reactants are favored  $K_{eq}$  is small ( $<1$ )

**Do Hebden set 24: p. 125 # 21-23, 24abcd, 26, 27**
