Name: $\qquad$ Block: $\qquad$

## IV. Acids \& Bases (part 2)

## IV. 7 Ionization constant of water- $\mathbf{K}_{w}$

You will be able to:

- Write equations representing the ionization of water using either $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{OH}^{-}$, or $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$
- Predict the effect of the addition of an acid or base to the equilibrium system: $2 \mathrm{H}_{2} \mathrm{O} \leftrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}$
- State the relative concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{OH}^{-}$in acid, base, and neutral solutions
- Write the equilibrium expression for the ion product constant of water (water ionization constant: Kw)
- State the value of Kw at $25^{\circ} \mathrm{C}$
- Describe and explain the variation in the value of Kw with temperature
- Calculate the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$(or $\mathrm{OH}^{-}$) given the other, using Kw

$$
\text { STRONG ACID + STRONG BASE } \rightleftarrows \text { SALT + WATER + HEAT }
$$

Example:

$$
\mathrm{HCl}_{(\mathrm{aq})}+\mathrm{NaOH}_{(\mathrm{aq})} \longleftrightarrow \mathrm{NaCl}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}+59 \mathrm{~kJ}
$$

Complete ionic equation: $\quad \mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{Cl}_{(\mathrm{aq})}+\mathrm{Na}^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})} \rightleftarrows \mathrm{Na}^{+}{ }_{(\mathrm{aq)}}+\mathrm{Cl}_{(\mathrm{aq})}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$
Net ionic equation:

|  |  |
| :---: | :--- |
| Reverse equation is the <br> SELF-IONIZATION <br> OF WATER | $\square$ |

Write the $K_{\mathrm{eq}}$ expression for this equilibrium:

$$
\mathbf{K}_{\mathrm{eq}}=\mathbf{K}_{\mathbf{w}}=
$$

| Definitions: | NEUTRAL solution |  |
| :--- | :--- | :--- |
|  | ACIDIC solution |  |
|  | BASIC solution |  |
|  |  |  |

Since reaction is endothermic: $\quad 59 \mathrm{KJ}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftarrows \mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}_{(\text {aq) }}^{-}$
As temp increases: shifts $\qquad$ , $\qquad$ are favoured,

- $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right],\left[\mathrm{OH}^{-}\right]$, and $\mathrm{K}_{\mathrm{w}}$ $\qquad$
- $\mathrm{pH}, \mathrm{pOH}$, and pKw $\qquad$ (details later).
$\qquad$ , $\qquad$ are favoured,
- $\quad\left[\mathrm{H}_{3} \mathrm{O}^{+}\right],\left[\mathrm{OH}^{-}\right]$, and $\mathrm{K}_{\mathrm{w}}$ $\qquad$
- $\mathrm{pH}, \mathrm{pOH}$, and pKw $\qquad$ (details later).

## Relative concentrations of $\mathrm{H}_{3} \mathrm{O}^{+}$and $\mathrm{OH}^{-}$in solutions:

Example 12: Calculate $\left[\mathrm{OH}^{-}\right]$in $0.00600 \mathrm{M} \mathrm{HNO}_{3}$ at $60^{\circ} \mathrm{C}$. Kw at $60^{\circ} \mathrm{C}=9.55 \times 10^{-14}$

| Step 1: Remember <br> $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[$strong acid $]$ |  |
| :--- | :--- |
| Step 2: Write out Kw <br> expression at temp |  |
| Step 3: Solve for [OH-] |  |
|  |  |

Example 13: Find $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$in $0.020 \mathrm{M} \mathrm{Ba}(\mathrm{OH})_{2}$ at $\mathbf{2 5}^{\circ} \mathrm{C}$.

| Step 1: Remember <br> [OH $]=[$ base $]$ x of OH's |  |
| :--- | :--- |
| Step 2: Write out Kw <br> expression at temp |  |
| Step 3: Solve for $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |  |
|  |  |

Do Hebden set 25: p. 127 \#28, 29abc, 30cd

## IV.8-9 $K_{\underline{a}}$ and $K_{\underline{b}}$

You will be able to:

- Write Ka and Kb equilibrium expressions for weak acids or weak bases
- Relate the magnitude of Ka or Kb to the strength of the acid or base
- Calculate the value of Kb for a base given the value of Ka of its conjugate acid (and vice versa)

The $K_{a}$ is the acid ionization constant of a WEAK acid. For example,
Write the ionization of boric acid in water:
The equilibrium expression for the ionization is: $\quad \mathbf{K}_{\mathrm{a}}=$
According to the table of relative strengths,
$\mathbf{K}_{\mathrm{a}}=$
The larger the Ka, the $\qquad$ the ACID.
The smaller the Ka, the $\qquad$ the ACID.
*For STRONG ACIDS, the Ka is "very large". Explain why.

The $K_{b}$ is the base ionization constant of a WEAK base. For example,
Write the ionization of ammonia in water:
The equilibrium expression for the ionization is: $\quad \mathbf{K}_{\mathbf{b}}=$
The table of relative strengths only lists the Ka!

Luckily, there is a relationship between conjugate pairs!

## For a CONJUGATE PAIR: $\mathbf{K}_{\mathrm{a}}($ conj acid $) \times K_{\mathrm{b}}(\operatorname{conj}$ base $)=\mathbf{K}_{\mathrm{w}}$

Using this equation, you can find the $K_{b}$ values for weak bases from the table!
Example 14: Calculate the $\mathrm{K}_{\mathrm{b}}$ of $\mathrm{HCO}_{3}{ }^{-}$at $\mathbf{2 5}^{\circ} \mathrm{C}$.

| Step 1: Look down the <br> RIGHT (base) side of table <br> until you find it. Write out <br> the ionization of its <br> CONJUGATE ACID. |  |
| :--- | :--- |
| Step 2: Write out the Kb <br> expression as its <br> relationship to the Ka of its <br> conj base. |  |
| Step 3: Solve for Kb |  |

## $\boldsymbol{K}_{a}$ and $\boldsymbol{K}_{b}$ can be compared against each other!

The greater the $\mathbf{K}_{\mathrm{a}}$ value, the $\qquad$ the acid.
The greater the $\mathbf{K}_{\mathbf{b}}$ value, the $\qquad$ the base.

Using $K_{\mathrm{a}}$ and $\mathrm{K}_{\mathrm{b}}$ to differentiate amphiprotic actions:
Example 15: When $\mathrm{HC}_{2} \mathrm{O}_{4}^{-}$reacts with water, will it preferrentially act as an ACID or a BASE?

| Step 1: Write out the <br> ionization equations for <br> amphiprotic substance <br> acting as an acid and a <br> base | As an ACID: |
| :--- | :--- |
| Step 2: Find the Ka and Kb <br> values for each ionization. <br> Solve for Kb. |  |
| Step 3: Compare Ka and <br> Kb. Larger value will <br> determine action. |  |

## Sample calculation involving $K_{a}$ and the WEAK (there will be many more of these coming up...)

Example 16: Find the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$in 0.10 M HF .
Step 1: Write out equilibrium equation for ionization

Step 2: Set up ICE table

Step 3: Write out the Ka expression

Step 4: State assumption

Step 5: Solve for x
$\left(\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\right)$

Do Hebden set 26: p. 128 \#31b, 32a, 33-35ab

## IV. 10 Relative Strengths of Acids and Bases

(already covered in Part 1 -- "Will equilibrium favour products or reactants?")
Summary:
In a B-L acid-base equilibrium, the side that has the $\qquad$ acid/base will be favoured.
"Strong PUSH the weak"
A second method for determining which side is favoured uses $\mathrm{K}_{\mathrm{a}}$ :

| $[$ products $]$ |
| :--- | :--- |
| [reactants] |$=\mathrm{K}_{\mathrm{eq}}=\frac{\mathrm{K}_{\mathrm{a}} \text { (reactant acid) }}{\mathrm{K}_{\mathrm{a}} \text { (product acid) }} \quad$ ( | You only have to use one method, so pick |
| :--- |
| whichever one works for you! |

## Relating $\mathbf{K}_{\text {eq }}$ to acid-base equilibrium

If products are favored $\mathrm{K}_{\mathrm{eq}}$ is large ( $>1$ )
If reactants are favored $\mathrm{K}_{\mathrm{eq}}$ is small $(<1)$

## IV. 11 pH and pOH

You will be able to:

- Define pH and pOH
- Define pKw , give its value at $25^{\circ} \mathrm{C}$, and its relation to pH and pOH
- Calculate $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right.$] or [OH-] from pH and pOH
- Describe the pH scale with reference to everyday solutions
$\mathbf{p H}$ is a shorthand method of showing acidity (or basicity, alkalinity)

$$
\mathrm{pH}=\text { "powers of } 10 \text { of }\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]
$$

## Definition of $\mathbf{p H}$

$\mathrm{pH}=$
$\mathrm{pOH}=$

## LOGS and ANTI-LOGS

This is a BRIEF summary of the math necessary for pH and pOH calculations. If you want more, check Hebden p. 134-139. p

In this class, all our log values will always be "logarithm to the base $\mathbf{1 0}$ ".

- LOG = $\qquad$
- ANTILOG = $\qquad$
$\log \left(10^{x}\right)=x$
$\operatorname{antilog}(x)=10^{x}$

CHECK your calculator!! LOG: Enter: $1 \rightarrow$ EXP $\rightarrow 7 \rightarrow+/-\rightarrow$ LOG $\rightarrow+/-$ and the answer should be 7 ANTILOG: $4 \rightarrow$ INV/2nd $\rightarrow$ LOG and the answer should be 1000

## Question TYPE 1: Converting from $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$or $[\mathrm{OH}-]$ to pH and pOH

Example 17: Find the pH of 0.030 M HCl
Step 1: Write out equation for ionization. Remember,
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=$[strong acid]
Step 2: Write out pH definition. Solve for pH . *Sig fig counting starts after $\mathrm{pH} / \mathrm{pOH}$ decimal place.*

Question TYPE 2: Converting from pH or pOH to $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$and $[\mathrm{OH}-]$
Example 18: If $\mathrm{pOH}=11.682$, what is the $[\mathrm{OH}-]$ in $\mathrm{Ca}(\mathrm{OH})_{2}$ ?

| Step 1: Write out <br> definition of pOH. Isolate <br> [OH-] (conver to antilog). |  |
| :--- | :--- |
| Step 2: Solve for [OH-]. |  |
| Step 3: Write out <br> ionization equation. <br> Remember, [OH-] $=$ <br> [strong base] x \# OH's <br> SSig fig counting starts <br> after pH/pOH decimal <br> place.* |  |

## pH and pOH Relationships

## Derive the relationship of pH and pOH :

Write out the Kw expression $\mathrm{K}_{\mathrm{w}}=$
and value at $25^{\circ} \mathrm{C}$
Take the $\log$ of both sides
Rewrite using:
$\log (A \times B)=\log (A)+\log (B)$
Plug in value of Kw
Therefore,
Remove negative (multiply
by -1 )
Therefore,

## Use "the SQUARE" for calculations at $25^{\circ} \mathrm{C}$

## SUMMARY:

At ALL temperatures: $\quad \mathrm{K}_{\mathrm{w}}=$ $\qquad$
$\mathrm{pK}_{\mathrm{w}}=$ $\qquad$

$$
\mathrm{pK}_{\mathrm{w}}=
$$

$\qquad$

## At $25^{\circ} \mathrm{C}$ ONLY:

$K_{w}=$ $\qquad$
$\mathrm{pK}_{\mathrm{w}}=$ $\qquad$
$\mathrm{pK}_{\mathrm{w}}=$ $\qquad$

## Question TYPE 3: Calculate [OH-] from pH or $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$from pOH

Example 19: If $\mathrm{pH}=6.330$, what is the $[\mathrm{OH}-]$ ?
Step 1: Calculate pOH from pH

Step 2: Calculate [OH-]
from pOH

## The pH Scale

| At $25{ }^{\circ} \mathrm{C}$ : | In neutral water | pH $=7.0$ |
| :---: | :---: | :---: |
|  | In acid solution | $\mathbf{p H}<7.0$ |
|  | In basic solution | $\mathbf{p H}>7.0$ |

| pH | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

$\left[\mathrm{OH}^{-}\right]$
pOH
14
0

## Pattens \& trends:

1. As pH $\qquad$ , pOH $\qquad$ .
2. a) A solution is $\qquad$ when its $\mathbf{p H}$ is $\qquad$ 7 or $\mathbf{p O H}$ is $\qquad$ 7.
b) A solution is $\qquad$ when its $\mathbf{p H}$ is $\qquad$ 7 , or $\mathbf{p O H}$ is $\qquad$ 7.
3. The pH scale is LOGARITHMIC, so...

- Each value on the pH scale represents a 10 x difference.
- When the $\mathbf{p H}$ is increased by $\mathbf{1}$, the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$is $\qquad$ .

4. In neutral water $\mathrm{pH}=\mathrm{pOH}$ at any temp.

- $\mathrm{pH} \& \mathrm{pOH}=7.00$ at $25^{\circ} \mathrm{C}$ ONLY
- At lower temps, pH and pOH are $\qquad$ 7
- At higher temps, pH and pOH are $\qquad$ 7

Do Hebden set 27: p. 139 \#49ab, 50abe, 51, 52; p. 141 \#55abcd, 56abed (Very important to master these calculations!)

## IV. 12 Mixtures of STRONG Acids and Bases

You will be able to:

- Determine whether a solution is acidic, basic, or neutral depending on the relative amounts of reactants involved.

Example 20: If 15.0 mL of 0.100 M HBr is added to 25.0 mL of $0.100 \mathrm{M} \mathrm{Mg}(\mathrm{OH})_{2}$, what is the pH of the resulting mixture?

| Step 1: Write out ionization <br> equations for both the SA and <br> SB. Determine [ $]$ based on |  |
| :--- | :--- |
| molar ratios. |  |

Example 21: What mass of $\mathrm{Ca}(\mathrm{OH})_{2}$ must be added to 500.0 mL of 0.0150 M HBr to create a solution with $\mathrm{pH}=2.750$ ? (Assume no volume change.)

| Step 1: Determine the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ <br> from pH |  |
| :--- | :--- |
| Step 2: Write expression for <br> excess ion. Solve for diluted <br> ion. |  |
| Step 3: Convert [ ] to grams |  |

Do Hebden set 28: p. 143 \#58-60, 63-65
